

72431

Soil

79.5 grams

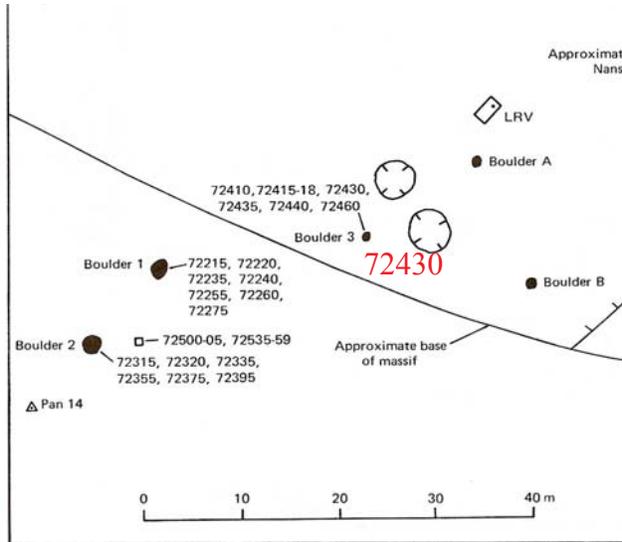

Figure 1: Map for station 2, Apollo 17.

Introduction

72430 is the soil scooped up when 72435 was picked up from the regolith after it was chipped from the boulder and it was returned in the same bag. It has exactly the same composition as the regolith from beneath the boulder (72420, 72426).

Petrography

Morris (1978) determined the maturity index ($I_s/FeO = 63$). Meyer (1973) cataloged the coarse-fines.

Chemistry

Korotev and Kremser (1992) determined the chemical composition by neutron activation analysis (table).

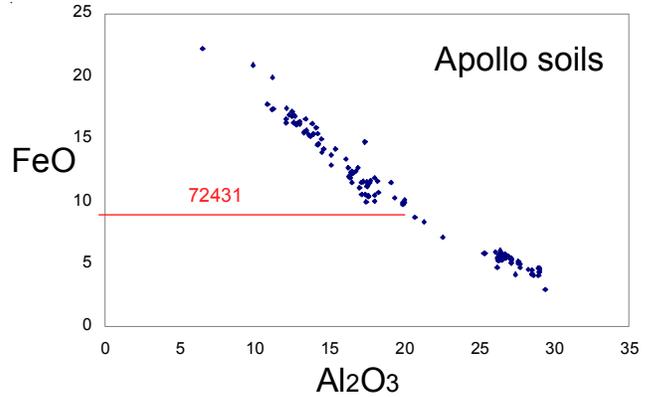

Figure 2: FeO content of 72431 compared with that of other Apollo soil samples.

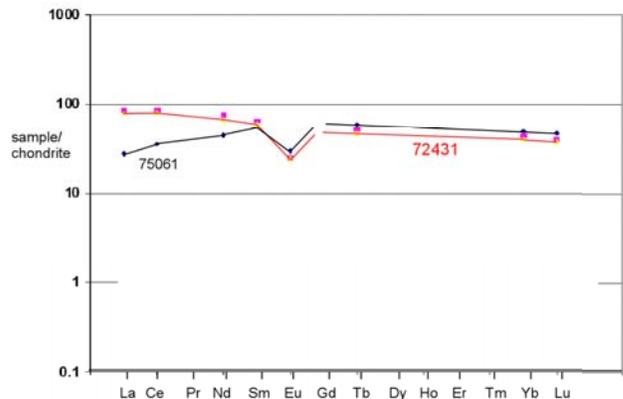

Figure 3: Normalized rare-earth-element diagram for 72431.

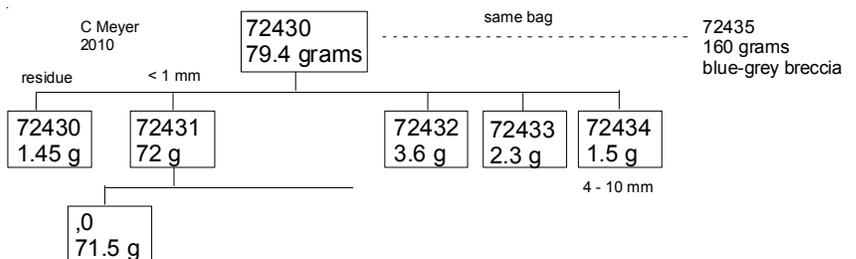

Table 1. Chemical composition of 72431.
